

PLANT HARDINESS ZONE 6 DATASET

COVER CROP DESCRIPTION

Vining cool-season annual. Reliable and widely used. Very winter-hardy. Little fall growth, but fast, vining spring growth makes it excellent for N fixation, biomass. Maturity can vary by variety, with 'Purple Bounty' maturing early. Residues release N fast. Good forage. Host to some problem nematodes. Small grain producers should use caution because of its tendency to volunteer and climb subsequent small grains (i.e. it can reduce yield, foul harvest equipment, and contaminate harvested grain). Hard seed can be nullified by scarification prior to planting. Mixes especially well with a rye cover crop; climbs small grain in mixes. Inoculate the seed with appropriate Rhizobium spp.; cross inoculates peas.

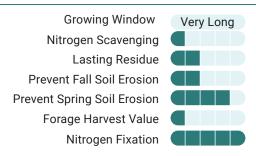

Vetch, Hairy - Ackroyd [2020]

Extended Comments

Termination: If using herbicides to terminate use a tank mixture (e.g., glyphosate + dicamba or 2,4-d). Roller crimping is most effective when first pods appear.

Forage and Grazing: Nobody can explain cause of hairy vetch toxicosis, which kills livestock. Not recommended for grazing/forage, but it's used elsewhere as part of a mix (<15%). Dilution may solve that issue, but it depends on what level of risk you're willing to take. Particularly palatable to voles.

Weeds: Good for suppressing winter annual weeds if planted early but this increases risk of winter-kill; when planted at standard timing, slow to suppress winter annuals but it does, eventually.

Pollinators: Very attractive to bumblebees. Delay termination until at least 30-50% bloom to maximize value to pollinators.

Nematodes: Supports reproduction of some root-knot nematode species/races.
